Department of Computer Science and Engineering

Guideline for Writing a Review Paper, Preparing Slides and Recording the Presentation

Read this file completely before you start writing.

Most of the marks are lost in small things - wrong template, missing citation, a video link nobody can open.

CSE 3200

Table of Contents (Clickable) 👆

1. What You Have to Submit 3
2. Use the IEEE Conference Template 3
3. Structure of Your Paper 4
4. Title 4
5. Author Block 5
6. Abstract 5
7. Keywords 6
8. Introduction 6
9. Literature Review 7
10. Methodology 8
11. Result and Discussion 10
12. Conclusion 10
13. References and IEEE In-Text Citation 11
14. Mistakes That Cost Marks Every Semester 12
15. Presentation Slides 13
16. Video Presentation 13
17. Uploading the Video and Sharing the Link 15
18. Submitting Through the Google Form 15
19. Final Checklist 16

1. What You Have to Submit

You have already chosen your field and read 10 papers. Now you have to turn that reading into one review paper, present it, and submit everything through a Google Form. The form link will be shared in Discord.

Five items must be ready before you open the form:

No.	Item	Format	How you submit it
1	Review paper (editable file)	.docx (if you use Word)	Upload the file
2	Review paper (final copy)	.pdf	Upload the file
3	Presentation slides	.ppt / .pptx	Upload the file
4	Video presentation	.mp4 uploaded online	Paste the YouTube or Google Drive link
5	Your information	Name, ID, section, paper title	Type into the form

> *If you write the paper in LaTeX (Overleaf) instead of Word, you do not need the .docx. Submit the PDF, and keep your Overleaf project link ready in case I ask for it.*

Deadline and naming

Name every file with your student ID and short name so that I can find it later. Example:

```
220101034_Rahim_ReviewPaper.docx
220101034_Rahim_ReviewPaper.pdf
220101034_Rahim_Slides.pptx
```

> *Submit at least one day before the deadline. Every year some students lose marks because the internet was slow on the last night, or Google Drive storage was full.*

2. Use the IEEE Conference Template

Do not design your own layout. Download the official IEEE conference template and type your content inside it. Two columns, 10 pt Times New Roman, A4 or US Letter - the template already handles all of this.

IEEE official templates: https://www.ieee.org/conferences/publishing/templates

Overleaf (LaTeX) template: https://www.overleaf.com/latex/templates/ieee-conference-template/grfzhhncsfqn

Word or LaTeX - your choice

	Word (.docx)	LaTeX (Overleaf)
Good for	Students who are new to writing No setup needed	Neat equations and references Auto numbering
Difficulty	Easy	Medium (needs practice)
You submit	DOCX + PDF	PDF (keep the Overleaf link)

Rules that apply either way

- Length: 4 to 6 pages including references. Do not go below 4.
- Do not change the font, font size, margin, or column width of the template.
- Do not delete the copyright line at the bottom of the first page if your template has one.
- Every figure and table must have a caption and must be mentioned in the text.
- Figure caption goes below the figure. Table caption goes above the table. This is the IEEE rule.
- Number figures as Fig. 1, Fig. 2 and tables as TABLE I, TABLE II.

3. Structure of Your Paper

Your paper must have these parts, in this order. Nothing extra, nothing missing.

Part	Roughly how long	What it does
Title	1 line	Tells the reader the topic in one line
Author block	3 lines	Your name, department, university, email
Abstract	150–250 words	The whole paper in one paragraph
Keywords	5–6 words/phrases	Helps people search and find your paper
I. Introduction	0.5–1 page	Background, problem, why this review is needed
II. Literature Review	1.5–2 pages	The 10 papers you read, discussed properly
III. Methodology	0.5–1 page	How you selected and studied the papers + flow diagram
IV. Result and Discussion	1–1.5 pages	What you found from comparing them
V. Conclusion	1 paragraph	Summary, limitation, future scope
References	10+ entries	IEEE format, all 10 papers

> *A review paper does not need your own experiment. Your job is to read, compare, organise and give an opinion about what other researchers have already done.*

4. Title

The title is the first thing a reader sees, and often the only thing. Spend ten minutes on it.

How to write it

1. Write down your topic in one plain sentence.
2. Cut all extra words until only the meaning is left.
3. Make sure the word "Review" or "Survey" appears, so the reader knows what type of paper it is.
4. Keep it between 8 and 15 words.

Examples

Weak title	Why it is weak	Better title
Machine Learning	Too broad. Could be anything.	A Review of Machine Learning Techniques for Early Detection of Diabetes
My Study on CNN and Skin Disease	"My study" is informal.	Deep Learning Approaches for Skin Lesion Classification: A Systematic Review
A Detailed and Comprehensive Analysis of the Various Different Methods Used in Sentiment Analysis of Bangla Text in Recent Years	Too long, repeats itself.	Sentiment Analysis of Bangla Text: A Review of Recent Approaches

- Do not use full stop at the end of the title.
- Capitalise the main words. Small words like of, for, and, in, the stay small (except the first word).
- Do not use short forms that nobody knows. CNN and IoT are fine. Your own invented short form is not.

5. Author Block

Right under the title, in the IEEE template, there is a place for author information. Fill it exactly like this:

Md. Rahim Hossain
Department of Computer Science and Engineering
Northern University of Business and Technology Khulna
Khulna, Bangladesh
rahim.cse@nubtkhulna.ac.bd

Points to remember

- Write your full name as it appears in your university record. No nickname.
- Department name must be written fully: Department of Computer Science and Engineering. Not "Dept. of CSE".
- University name must be written fully: Northern University of Business and Technology Khulna.
- Add the city and country on a separate line: Khulna, Bangladesh.
- Use a professional email. **Your university email is best.** If you use Gmail, it must look like a name - for example rahim.hossain.cse@gmail.com.

> *Emails like cute_boy_007@gmail.com or bts_lover99@gmail.com will not be accepted. A published paper stays on the internet for the rest of your life.*

6. Abstract

The abstract is one single paragraph that contains the whole paper in short. Many readers read only this part, then decide whether to read the rest. Write it last, after everything else is finished.

Length and form

- 150 to 250 words.
- One paragraph. No bullet points, no headings, no figures, no equations.
- No citation numbers like [3] inside the abstract.
- Past tense for what you did, present tense for general facts.

The five sentences formula

If you get stuck, write these five things one after another. That is already an abstract.

#	What to write	Example sentence
1	Background - why the topic matters	Skin cancer is one of the most common cancers, and early detection saves lives.
2	Problem or gap	Manual diagnosis is slow and depends on the experience of the doctor.
3	What this review does	This paper reviews ten recent studies on deep learning based skin lesion classification published between 2019 and 2025.
4	What you found	The reviewed works mostly use transfer learning on the HAM10000 dataset, and report accuracy between 80% and 93%, but very few of them test on an external dataset.
5	Conclusion or direction	The review shows that class imbalance and lack of external validation remain the main open problems in this area.

How to read an abstract (this helps you write one)

When you read the abstracts of your 10 papers, do it like this. It takes two minutes per paper and saves hours later.

1. Read the first sentence - that gives you the field.
2. Find the sentence with "however", "but", "limited", "lack of" - that is the gap the authors are attacking.
3. Find the sentence starting with "In this paper" or "This work proposes" - that is their contribution.
4. Find the numbers - accuracy, dataset size, error. Write them in your notebook immediately.
5. Read the last sentence - that is their claim.

> *Keep one table in Excel or a notebook with these columns: paper number, author, year, method, dataset, result, limitation. Fill it while reading. When you sit to write the paper, this table becomes your literature review and your result section.*

7. Keywords

What is a keyword?

A keyword is a word or a short phrase that describes the main content of your paper. Search engines, digital libraries like IEEE Xplore, and other researchers use these words to find your work. If somebody searches that word and your paper does not contain it as a keyword, your paper will never appear in their search result. That is the whole purpose.

How to choose 5–6 keywords

1. Take your title and pick the 2–3 most important terms from it.
2. Add the name of the main method or technology you discuss (for example, Convolutional Neural Network, Transfer Learning).
3. Add the name of the dataset or application area (for example, HAM10000, Medical Imaging).
4. Add the general field (for example, Deep Learning, Natural Language Processing).
5. Check the keywords used by the 10 papers you read. If the same word appears again and again, it is a standard word in that field - use it.

Rules

- 5 to 6 keywords is the requirement for this assignment.
- Separate them with commas, in the order general to specific, and put a full stop at the end.
- Each keyword starts with a capital letter.
- Do not repeat the whole title as one keyword.
- Do not use very general words alone, like "Computer", "System", "Technology", "Data".

Example

```
Index Terms-Deep learning, Skin lesion classification,
Transfer learning, Convolutional neural network,
HAM10000, Medical image analysis.
```

> *In the IEEE template, keywords are written after the abstract under the label "Index Terms". Keep that label - do not change it to "Keywords".*

8. Introduction

The introduction takes the reader from the general topic to your specific review. Think of a funnel: wide at the top, narrow at the bottom.

Write it in four paragraphs

Paragraph	Content	Citations needed?
1. Background	What is the field. Why is it important. Give one real fact or number if you can.	Yes, 1–2
2. Current situation	What are researchers doing now. Which techniques are common.	Yes, 3–5
3. The gap	What is still missing, confusing, or not compared properly. This is the reason your review exists.	Yes, 1–2
4. This paper	What your review covers, how many papers, which years, and what the reader will get. End with the organisation of the paper.	No

Ending sentence of the introduction

Always end with a short road map. Copy this pattern and change the section names:

> The rest of this paper is organized as follows. Section II presents
> the literature review. Section III describes the methodology.
> Section IV discusses the findings, and Section V concludes the paper.

How to read an introduction of other papers

- Look at paragraph 3 of their introduction - that is where they state the gap. Their gap often becomes your review's topic.
- Look at which papers they cite in the introduction. Those are the important papers of the field, and you should probably read some of them too.
- Notice how they move from general to specific. Copy the structure, never the sentences.

> *Copying sentences from any paper is plagiarism, even if you cite it. Read, close the paper, then write from your own memory in your own words. If you must use their exact sentence, put it inside quotation marks and cite it - but do this at most once or twice in the whole paper.*

9. Literature Review

This is the heart of a review paper and carries the most marks. All 10 papers must appear here. But do not write ten separate paragraphs one after another like a list - that is a summary, not a review.

Two ways to organise it (pick one)

Method	How it works	Best when
By theme	Group the papers by the technique they use. For example: 2.1 Traditional machine learning methods, 2.2 CNN based methods, 2.3 Transformer based methods.	Your 10 papers use different kinds of methods
By timeline	Discuss the papers in order of year and show how the field developed from older methods to newer ones.	Your papers show a clear year-by-year progress

What to write about each paper

For every paper give these four things in two or three sentences, then move on:

- Who did it and in which year (through the citation).
- What method or model they used.
- What dataset they used and what result they got.
- One limitation or weakness you noticed.

Example of a good paragraph

> *Chaturvedi et al. [4] applied MobileNet to the seven-class HAM10000 dataset and reported 83.1% accuracy with a small model suitable for mobile devices. However, the study did not report per-class results, so the performance on rare classes such as dermatofibroma remains unclear. A similar limitation appears in [5], where the reported accuracy is high but the class imbalance of the dataset is not addressed.*

Notice three things in that example: the method, the number, and the criticism. Also notice that two papers were connected in one paragraph. That connection is what makes it a review instead of a list.

The comparison table - do not skip this

End your literature review with one table that puts all 10 papers side by side. This table alone can carry your whole paper.

Ref.	Year	Method	Dataset	Result	Limitation
[1]	2019	AlexNet + augmentation	ISIC 2017	88.2% acc.	Small dataset
[2]	2020	MobileNet	HAM10000	83.1% acc.	No per-class result
[3]	2022	EfficientNetB4	HAM10000	91.0% acc.	No external test
...	...	...	...	...	...

> *Sort the table by year. It instantly shows the reader how the field moved forward, and it is the easiest table you will ever make.*

10. Methodology

In a review paper, methodology means: how did you find, select and study the papers? It is short but it must be there, and it must contain at least one flow diagram.

What to write

1. Sources: where you searched - IEEE Xplore, ScienceDirect, SpringerLink, Google Scholar, arXiv.
2. Search terms: the exact words you typed, for example "deep learning" AND "skin lesion classification".
3. Year range: for example 2019 to 2025.
4. Inclusion criteria: peer-reviewed, written in English, reports results on a public dataset.
5. Exclusion criteria: no results reported, not related to the topic, duplicate versions of the same work.
6. Final number: how many papers you found at first and how many you kept (10).
7. What you recorded from each paper: method, dataset, metric, limitation.

The flow diagram (compulsory)

Draw a simple top-to-bottom flow chart of the process above. Five or six boxes are enough:

```
[ Search in IEEE Xplore, Scopus, Google Scholar ]
                |
[ 60 papers found (2019 - 2025) ]
                |
[ Remove duplicates and non-English -> 42 papers ]
                |
[ Screen title and abstract -> 18 papers ]
                |
[ Full text reading and final selection -> 10 papers ]
                |
[ Extract method, dataset, result, limitation ]
                |
[ Comparison and discussion ]
```

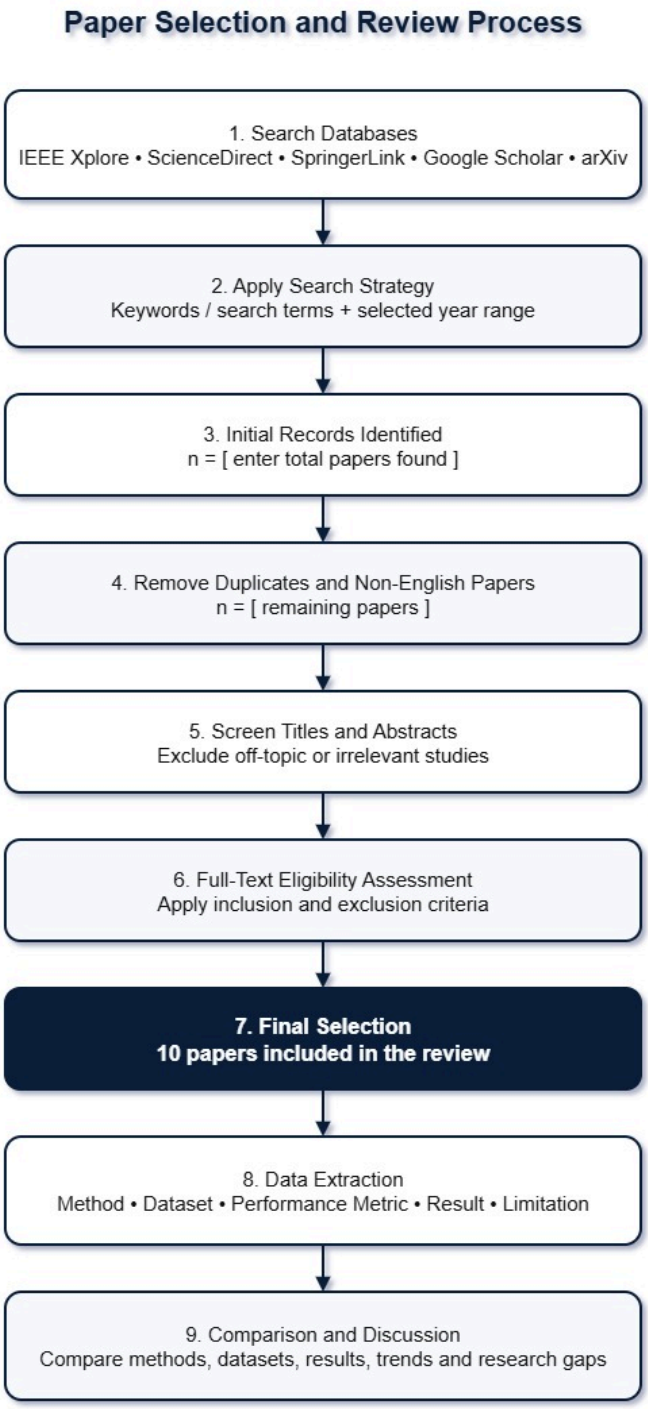

Figure 1. Fflow diagram

Tools you can use to draw it

- draw.io (diagrams.net) - free, no login needed, export as PNG.
- Microsoft Word SmartArt or Shapes - fine for a simple flow.
- Canva or Figma - if you want it to look nicer.
- Lucidchart - free plan is enough for this.

Diagram rules

- Export at high resolution (at least 300 DPI, or a large PNG). A blurry diagram loses marks.

- The text inside the boxes must be readable when the figure sits in one column of the IEEE template.
- Give it a caption below: Fig. 1. Paper selection and review process.
- Mention it in the text: "Fig. 1 shows the overall selection process." A figure that is never mentioned should not exist.

11. Result and Discussion

In a review paper you have no experiment, so your "result" is what you learned by comparing the 10 papers. This is where you show that you actually thought about them and did not only read them.

Things you can present as results

What you show	How to present it
Which methods are most popular	A bar chart: how many of the 10 papers used CNN, transformer, classical ML
How performance changed over years	A line chart or scatter: year on x-axis, accuracy on y-axis
Which datasets are used	A pie chart or a small table
Which evaluation metrics are used	A table showing which papers report accuracy, F1, AUC
Common limitations	A short list with how many papers had each problem

Then discuss - this part is the real marks

After showing the numbers, answer these questions in words:

- Which approach works best, and under what condition?
- Why do some papers report higher accuracy? Is it a better model, or just an easier dataset?
- Are the results even comparable? Different splits and different datasets make direct comparison unfair - say so if that is the case.
- What problem did almost everybody ignore? (class imbalance, external validation, running time, explainability)
- What should the next researcher do?

> *Do not write "all papers are good and gave good accuracy". That single sentence tells me you did not read them carefully. A review without criticism is not a review.*

Chart tips

- Excel or Google Sheets is enough. Python with matplotlib is also fine.
- Label both axes and write the unit.
- Keep the font size readable after the chart is shrunk into one column.
- Do not use a 3D pie chart. It looks nice and hides the data.

12. Conclusion

One paragraph, 120 to 200 words. No new information, no new citation, no new figure.

Write these four things:

1. What you reviewed and how many papers.
2. The two or three main things you found.
3. The limitation of your own review (for example: only 10 papers, only English, only 2019–2025, only one subfield).

4. What future researchers should do.

> *Being honest about the limitation of your own work is a sign of a good researcher, not a weak one. Every good paper does it.*

13. References and IEEE In-Text Citation

The two rules

- In the text, cite with a number in square brackets: [1], [2], [3].
- Numbers are given in the order the citation first appears in your text - not alphabetically. The first paper you cite is [1], the second is [2], and so on.

How to write the citation inside a sentence

Situation	How to write it
One reference	Transfer learning has been widely used for this task [3].
Two references	Similar results were reported in [3], [7].
Three or more in a range	Several studies used the HAM10000 dataset [2]-[5].
Author name in the sentence	Esteva et al. [4] reported dermatologist-level accuracy.
Reference as a word in the sentence	The method proposed in [6] reduces training time.

- Put the bracket before the full stop, not after: ... in this field [5].
- Do not write "In [5], Rahman et al. [5] showed..." - cite once.
- Never write (Rahman, 2021). That is APA style, not IEEE.
- Every reference in your list must be cited at least once in the text. If it is never cited, remove it.

Reference list format

Authors are written as initials first, then surname. Titles of papers go inside quotation marks. Journal and conference names are in italics. Follow these patterns exactly.

Journal paper

[1] A. Esteva, B. Kuprel, and R. A. Novoa, "Dermatologist-level classification of skin cancer with deep neural networks," Nature, vol. 542, no. 7639, pp. 115-118, Feb. 2017.

Conference paper

[2] S. S. Chaturvedi, K. Gupta, and P. S. Prasad, "Skin lesion analyser using MobileNet," in Proc. Int. Conf. Advanced Machine Learning Technologies and Applications (AMLTA), Jaipur, India, 2020, pp. 165-176.

Book

[3] I. Goodfellow, Y. Bengio, and A. Courville, Deep Learning, Cambridge, MA, USA: MIT Press, 2016, pp. 326-366.

Website

[4] ISIC Archive. "International Skin Imaging Collaboration." Accessed: Mar. 10, 2026. [Online]. Available: https://www.isic-archive.com

arXiv preprint

[5] M. Tan and Q. V. Le, "EfficientNet: Rethinking model scaling for convolutional neural networks," arXiv:1905.11946, 2019.

A shortcut that saves time

1. Open the paper in Google Scholar.
2. Click the quotation mark icon under the paper.
3. Choose MLA/APA/Chicago... then click BibTeX, or use IEEE Xplore's own "Cite This" button which gives IEEE format directly.
4. Paste it, then check it by hand. Google Scholar makes mistakes with page numbers and conference names.

> *Use a reference manager (Mendeley or Zotero) if you can. Both are free, both have a Word plugin, and both can switch the whole paper to IEEE style with one click. Learning it now will save you in your thesis.*

14. Mistakes That Cost Marks Every Semester

Mistake	What to do instead
Copy-pasting sentences from the papers	Read, close the paper, write from memory in your own words
Writing ten separate summaries with no connection	Group papers by theme and compare them inside the same paragraph
No in-text citation, only a reference list	Every claim that is not yours needs a [number]
Citation numbers not in order of appearance	The first one you cite is [1]. Fix the order at the end
Figure or table never mentioned in the text	Write "as shown in Fig. 1" or "Table I compares..."
Blurry or unreadable diagram	Export as high-resolution PNG, check it after inserting
Abstract with citations or bullet points	One clean paragraph, no [numbers]
Changing the IEEE template fonts and margins	Type inside the template, change nothing
Writing "I" and "we did" everywhere	Use neutral academic language: "This review analyses..."
Using ChatGPT text as it is	You must be able to explain every sentence in the viva. If you cannot, rewrite it
Submitting only PDF when Word was used	Both DOCX and PDF are required
Video link that opens only for you	Set it to Public or Anyone with the link, and test it

15. Presentation Slides

After the paper is done, make the slides. The slides are not a copy of the paper - they are a shorter, visual version for a listener.

Slide plan (12 to 15 slides, 8 to 10 minutes)

Slide	Content	Time
1	Title, your name, department, university, date	20 sec
2	Outline of the talk	20 sec
3	Introduction - background and why it matters	1 min
4	Problem statement / the gap	45 sec
5	Objective of this review	30 sec
6–8	Literature review - grouped by theme, with your comparison table	2.5 min
9	Methodology with the flow diagram	1 min
10–11	Result and discussion, with your charts	2 min
12	Key findings - 3 bullet points only	45 sec
13	Limitations and future work	40 sec
14	Conclusion	30 sec
15	References (main ones) and Thank You	20 sec

Design rules

- Maximum 6 lines per slide, maximum 8 words per line. Keywords, not sentences.
- Title 32–40 pt, body 20–24 pt. If you need smaller than 18 pt, you are putting too much on the slide.
- Use one font family for the whole deck. Calibri or Arial is safe.
- Dark text on light background, or light text on dark background. Nothing in between.
- Use the same colour scheme on every slide. Two colours plus one accent is enough.
- Every table and figure you paste must still be readable on the slide. If it is not, show only part of it.
- Put slide numbers in the corner.
- No animation on every line. It wastes time and looks unprofessional.

> *A separate PowerPoint template file is given with this guideline. Open it, replace the placeholder text, and your deck is ready. You may change the colours if you want - just keep them consistent.*

Practise before recording

- Write down what you will say for each slide. Do not read it word by word while recording, but having it written helps.
- Practise out loud at least twice with a timer.
- If you finish in 4 minutes, you are reading too fast. If you cross 12 minutes, cut some slides.

16. Video Presentation

You have to record yourself presenting the slides. Your face is not mandatory, but your voice is. A silent screen recording gets zero.

Requirements

Item	Requirement
Length	8 to 12 minutes
Voice	Compulsory - your own voice, clearly audible
Face / webcam	Optional
Screen	Your slides must be visible in full screen
Resolution	720p (1280×720) or better
Format	MP4 is safest
Language	English preferred. If you present in Bangla, technical terms stay in English

Recording with OBS Studio (free)

1. Download OBS Studio from obsproject.com and install it. Skip the auto-configuration wizard or just accept the defaults.
2. In the Sources box at the bottom, click + and choose Display Capture (for the whole screen) or Window Capture (for only the PowerPoint window).
3. Click + again and add Audio Input Capture, then select your microphone.
4. Speak and watch the audio meter in the Audio Mixer. The green bar should move around the middle. If it touches red, lower the volume.
5. If you want your face, click + and add Video Capture Device, then drag the small webcam box to a corner.
6. Go to Settings → Output and set the recording format to mp4. Set the recording path to a folder you can find.
7. Open your PowerPoint and press F5 to start the slideshow.
8. Come back to OBS, press Start Recording, wait two seconds, then start speaking.
9. When finished, press Stop Recording. The file will be in the folder you set.
10. Play the whole video once before uploading. Check that the audio exists from beginning to end.

Other software you may use

- PowerPoint itself: Slide Show tab → Record Slide Show → then File → Export → Create a Video.
- Zoom or Google Meet: start a meeting alone, share your screen, record, then download the MP4.
- Screen recorder apps like Loom, ScreenRec, or the Xbox Game Bar (Windows key + G).

Practical tips

- Record in a quiet room. Close the window and switch the fan off if it is noisy.
- A simple earphone mic is much better than the laptop's built-in mic. Keep it close to your mouth but not touching it.
- Turn off notifications on your phone and laptop before recording.
- Close WhatsApp, Messenger and your browser tabs - a message popping up in the middle looks bad.
- You do not have to record it perfectly in one go. Stop and record again if you make a mistake.
- Start by introducing yourself: "Hello….. I am ... from the Department of CSE, NUBT Khulna. Today I will present my review paper on ..."

17. Uploading the Video and Sharing the Link

This is where most submission problems happen. Follow one of the two options below and then test the link.

Option A - YouTube (recommended)

1. Go to youtube.com and sign in.
2. Click the camera icon at the top right → Upload video.
3. Select your MP4 file.
4. Title it like this: Review Paper Presentation - [Your Name] - [Student ID].
5. On the "Audience" question choose "No, it's not made for kids".
6. On the Visibility page choose Public. Unlisted also works, but Public is safest for this submission.
7. Wait until processing finishes, then copy the video link.

Option B - Google Drive

1. Upload the MP4 to your Google Drive.
2. Right click the file → Share.
3. Under General access, change "Restricted" to "Anyone with the link".
4. Keep the role as Viewer.
5. Click Copy link.

Test the link - this step is compulsory

- Open the link in an incognito / private browser window. If it asks for permission, the link is wrong.
- Or send the link to a friend and ask them to open it and confirm.
- A link that I cannot open will be treated as no submission. Nobody gets a second chance for this.

> *Do not delete, rename, or move the file after submitting. The link will break.*

18. Submitting Through the Google Form

The form link will be shared in Discord. Before you open it, keep these ready on your desktop:

- The DOCX file (if you used Word) or zip file (if you used LaTeX)
- The PDF file.
- The PPT / PPTX file.
- The video link, already tested.
- Your name, student ID, section and paper title.

Sign in to the form with your Google account, fill everything, upload the files, paste the link, and submit. Take a screenshot of the confirmation page and keep it.

If you see "Server Rejected" during submission

This message usually means your Google account storage is full. Do one of the following:

1. Free up some space in your Google Drive (delete large files, then empty the Trash - files in Trash still take space).
2. Or sign in with a different Google account and submit the form again.

> *If the problem still does not go away, message me in Discord before the deadline with a screenshot. Telling me after the deadline will not help.*

19. Final Checklist

Tick every line before you submit. If any line is unticked, you are not ready.

Paper

- IEEE conference template used, nothing modified
- Title is clear and contains the word Review or Survey
- Full name, Department of Computer Science and Engineering, Northern University of Business and Technology Khulna, Khulna, Bangladesh, professional email
- Abstract is one paragraph, 150–250 words, no citations
- 5–6 keywords under Index Terms
- Introduction ends with the organisation of the paper
- All 10 papers discussed in the literature review, with a comparison table
- Methodology has at least one flow diagram with a caption
- Result and discussion contains at least one chart or table and real criticism
- Conclusion mentions limitation and future work
- 10 or more references in IEEE format
- Every reference is cited in the text, and the numbers are in order of appearance
- Every figure and table is mentioned in the text
- Spelling and grammar checked once from top to bottom
- Paper is 4–6 pages

Slides

- 12–15 slides
- Title slide has your name, department and university
- Flow diagram and comparison table included and readable
- No slide is overloaded with text
- Slide numbers added

Video

- 8–12 minutes
- Voice is clear from start to end
- Slides are visible in full screen
- Uploaded and set to Public (YouTube) or Anyone with the link (Drive)
- Link tested in incognito or by a friend

Submission

- DOCX uploaded (if Word was used) OR LaTex Zip/Link
- PDF uploaded
- PPT uploaded
- Video link pasted
